

ABOUT ME

Final-year ECE student with a CS minor at PES University, aspiring Product Manager with a strong data and technical background focused on translating user and business problems into data-driven product decisions. Skilled in translating raw data into product insights through KPI definition, Power BI dashboards, and SQL data modeling. Aiming to add value to data and business teams through analytical problem solving, data visualization, and process optimization.

EXPERIENCE AND PROJECTS

Research Intern (L&T funded project)

- Development of a AI powered machine and translating industrial manufacturing requirements (payload, precision, mobility constraints) into system-level specifications and architecture for an autonomous robotic platform.
- Led component evaluation and cost-performance trade-off analysis (LiDAR, actuators, embedded compute including NVIDIA Jetson Nano) to optimize scalability and manufacturability.
- Coordinated mechanical, electrical, and navigation subsystems to ensure cross-functional alignment from design to system validation.

Artificial Intelligence intern (AI) – June 2025 – August 2025

- Worked in a virtual internship as an AI intern, where I built and automated the workflow using Agentic AI.
- I trained ML models and built AI systems to perform multiple tasks, improving performance to around 85%.

Sales Analytics Dashboard – Power BI & SQL

Personal Project

- Built a decision-support dashboard to improve visibility into sales performance and product trends, customer trends, and product category insights using the AdventureWorksDW2022 dataset.
- Extracted, transformed, and modeled data with SQL and SSMS; designed relationships, created DAX measures, and implemented KPI cards for sales vs budget variance tracking.
- Developed dynamic visualizations including Top 10 customers/products, monthly sales trends, category distribution charts, and geographic sales mapping with slicer filters.
- Delivered a decision-support analytics solution enabling faster revenue monitoring, high-value customer identification, and data-driven budgeting improvements.

Product Segmentation – Python & K-Means

Personal Project

- Analyzed product performance to identify distinct segments and generate insights for product prioritization on sales data using Python, Pandas, and K-Means clustering.
- Aggregated transaction data to compute product metrics (e.g., total sales, quantity, average values) and standardized features with `StandardScaler`.
- Identified distinct product clusters and visualized them to compare sales performance patterns across groups.
- Generated Insights to prioritize top-performing products and target low-engagement segments.

EDUCATION

PES University, Bengaluru, Karnataka

2022 – 2026

B.Tech in Electronics and Communication (Major) with Minors in Computer Science

NRI Junior College, Guntur

2020 – 2022

Andhra Pradesh Board of Education

SKILLS

Programming Languages: Python (Pandas, NumPy, Matplotlib) , SQL, C

Soft Skills: Product Life Cycle(PLC), product requirement documentation (PRD), Research, KPI definition, Team work, Leadership, Communication, Problem solving, Creativity, Innovation, Dashboarding, Business Understanding.

Tools & Technologies: PowerBI, AI, MySQL, Git, VS Code, Unreal Engine, GODOT, Microsoft tools, Excel (Pivot Tables, VLOOKUP, Power Query), ROS, Fusion 360, SolidWorks

CORE COMPETENCIES

Problem Solving — Data Structures & Algorithms — DBMS — Full-Stack Development — Schema interpretation

Team Collaboration — Innovation — Communication — Debugging & Testing — Version Control — Data Modeling

ADDITIONAL INFORMATION

Hobbies: Solving puzzles, game development, space technology, financial analysis, sports, drawing, traveling, and Amazon affiliate marketing.
